

Network Engineer – Interview Prep Guide

Q: What is the role of a network engineer?

A: They design, implement, manage, and troubleshoot computer networks to ensure reliability and security.

Q: What protocols are essential for network engineers?

A: TCP/IP, OSPF, BGP, EIGRP, MPLS, VLAN, and VPN protocols.

Q: What's the difference between a switch and a router?

A: Switches connect devices in a LAN, while routers connect different networks and manage traffic between them.

Q: How do you secure a network?

A: Using firewalls, IDS/IPS, VPNs, access control lists, and regular patching.

Q: What is subnetting and why is it important?

A: Subnetting divides a network into smaller segments for efficiency, performance, and security.

Q: How do you troubleshoot network latency issues?

A: By checking bandwidth usage, using traceroute, ping tests, and analyzing packet loss.

Q: What tools do you use?

A: Wireshark, SolarWinds, Cisco Packet Tracer, Nagios, and NetFlow analyzers.

Q: Can you explain QoS (Quality of Service)?

A: QoS prioritizes critical network traffic (like VoIP) to ensure performance under load.
